Lineage-based Storage Architecture (LSA): Overview

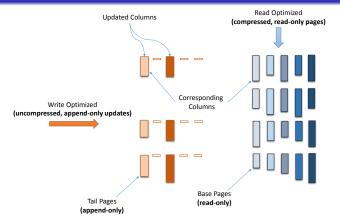

Overview of the lineage-based storage architecture (base pages and tail pages are handled identically at the storage layer)

Mohammad Sadoghi ECS165A 8 / 16

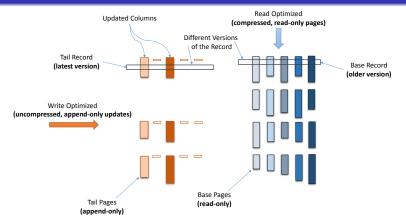

Records are range-partitioned and compressed into a set of ready-only **base pages** (accelerating analytical queries)

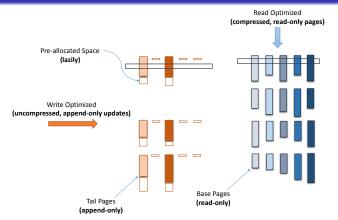

Recent updates for a range of records are clustered in their **tails pages** (transforming costly point updates into an amortized analytical-like query)

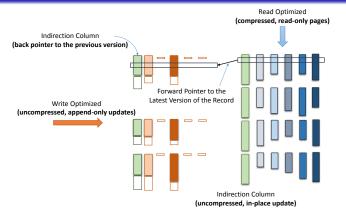

Recent updates for a range of records are clustered in their **tails pages** (transforming costly point updates into an amortized analytical-like query)

Recent updates are strictly appended, uncompressed in the pre-allocated space (eliminating the read/write contention)

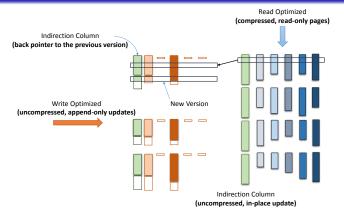

Achieving (at most) 2-hop access to the latest version of any record (avoiding read performance deterioration for point queries)

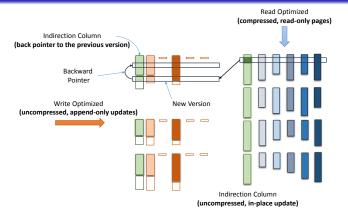

Mohammad Sadoghi ECS165A 9 / 16

Achieving (at most) 2-hop access to the latest version of any record (avoiding read performance deterioration for point queries)

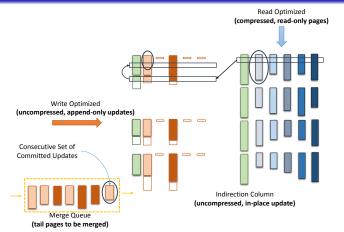

L-Store: Detailed Design

Achieving (at most) 2-hop access to the latest version of any record (avoiding read performance deterioration for point queries)

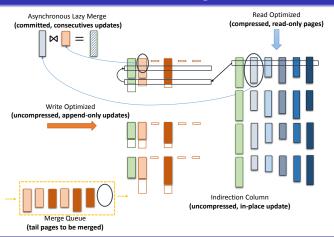

L-Store: Contention-free Merge

Contention-free merging of only stable data: read-only and committed data (no need to block on-going and new transactions)

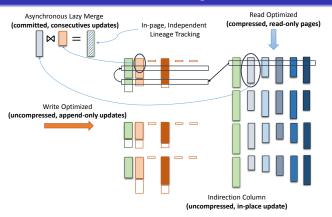

L-Store: Contention-free Merge

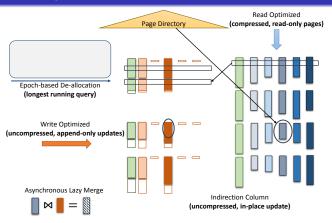

Lazy independent merging of **base pages** with their corresponding **tail pages** (resembling a local left outer-join of the base and tail pages)

L-Store: Contention-free Merge

Independently tracking the lineage information within every page (no need to coordinate merges among different columns of the same records)

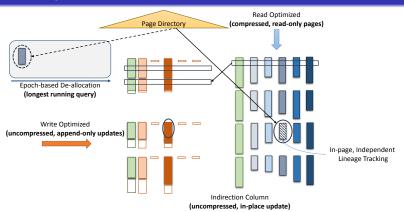

Contention-free page de-allocation using an epoch-based approach (no need to drain the ongoing transactions)

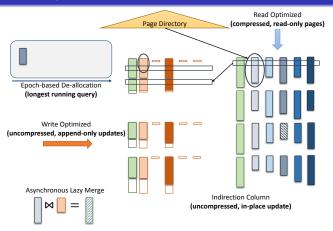

Mohammad Sadoghi ECS165A 9 / 16

Contention-free page de-allocation using an epoch-based approach (no need to drain the ongoing transactions)

Experimental Analysis

Mohammad Sadoghi ECS165A 10 / 16

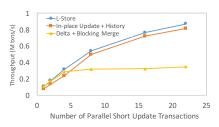

Experimental Settings

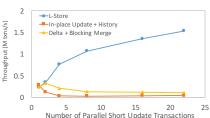

- Hardware:
 - 2 × 6-core Intel(R) Xeon(R) CPU E5-2430 @ 2.20GHz, 64GB, 15 MB L3 cache
- Workload: Extended Microsoft Hekaton Benchmark
 - Comparison with *In-place Update* + *History* and *Delta* + *Blocking Merge*
 - Effect of varying contention levels
 - Effect of varying the read/write ratio of short update transactions
 - Effect of merge frequency on scan
 - Effect of varying the number of short update vs. long read-only transactions
 - Effect of varying L-Store data layouts (row vs. columnar)
 - Effect of varying the percentage of columns read in point queries
 - Comparison with log-structured storage architecture (*LevelDB*)

 00

Effect of Varying Contention Levels

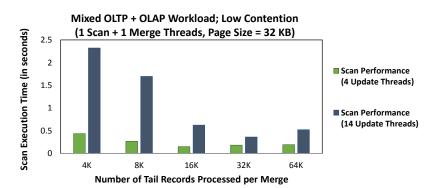

Achieving up to $40\times$ as increasing the update contention

Mohammad Sadoghi ECS165A 12 / 16

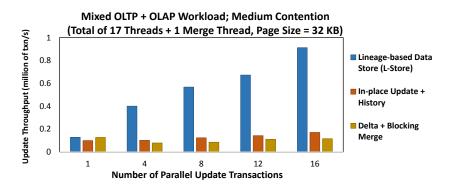

Effect of Merge Frequency on Scan Performance

Merge process is essential in maintaining efficient scan performance

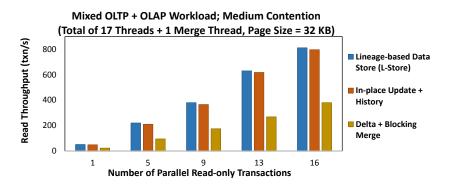

Mohammad Sadoghi ECS165A 13 / 16

Effect of Mixed Workloads: Update Performance

Eliminating latching & locking results in a substantial performance improvement

Effect of Mixed Workloads: Read Performance

Coping with tens of update threads with a single merge thread

L-Store Key Contributions

Motivations

- Unifying OLAP & OLTP by introducing lineage-based storage architecture (LSA)
- LSA is a native multi-version, columnar storage model that lazily & independently stages data from a write-optimized layout into a read-optimized one
- Contention-free merging of only stable data without blocking ongoing or incoming transactions
- Contention-free page de-allocation without draining ongoing transactions
- L-Store outperforms in-place update & delta approaches by factor of up to $\mathbf{8} \times$ on mixed OLTP/OLAP workloads and up to $\mathbf{40} \times$ on update-intensive workloads

Mohammad Sadoghi ECS165A 15 / 16
