# Hardware Trends

Large core counts

Large main-memory

HPE Superdome Flex for SAP HANA Scale-out configuration

HPE Superdome Server  
144 physical cores  
6TB of RAM

# Popularity of Key-value Stores

- No multi-statement transactions
- Weak consistency
- Weak isolation

# High-Contention Workloads

Challenge ???

High number of  
contented operations

# State-of-the-Art Concurrency Control Protocols

- Optimized for multi-core hardware and main-memory databases
- Non-deterministic

CC	Class	Year
SILO	Optimistic CC	SOSP '13
TICTOC	Timestamp Ordering	SIGMOD '16
FOEDUS-MOCC	Optimistic CC	VLDB '16
ERMIA	MVCC	SIGMOD '16
Cicada	MVCC	SIGMOD '17

# Performance Under High-Contention

Optimize-for-multi-core concurrency control techniques suffer under high-contention due to increasing abort rate

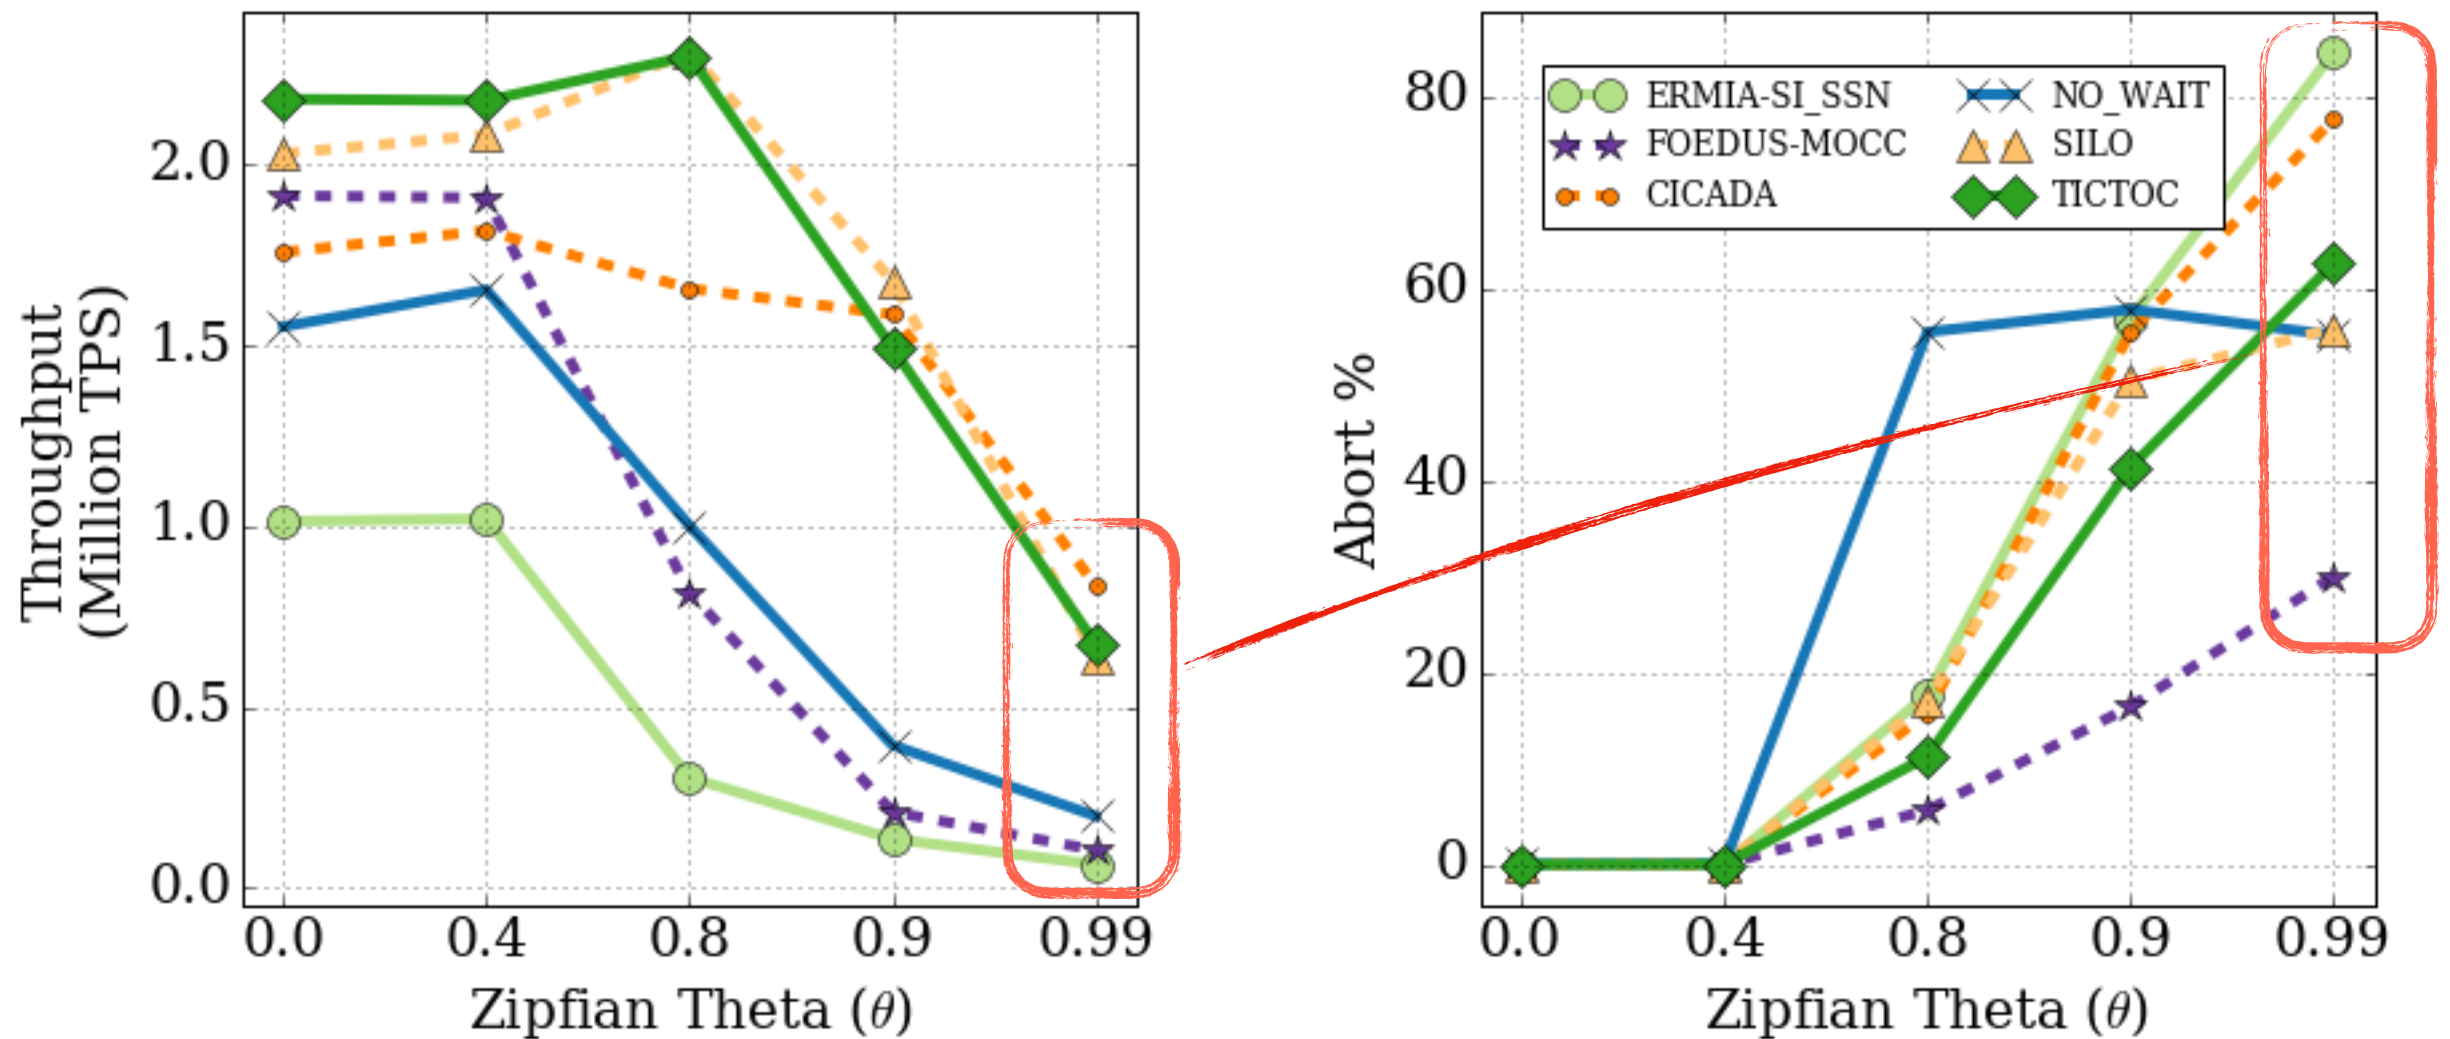

# Performance Under High-Contention

Under high-contention: Non-deterministic aborts dominates

# Performance Under High-Contention

Under high-contention: Non-deterministic aborts dominates

- Eventually transactions commit in some serial order!
- Many aborts due to high contention on record b
- Non-determinism in CC cause these aborts
- Wasted work

Committed Transactions

# Key Insights

- Many aborts due to high contention
- Non-determinism in CC cause these aborts
- Can we do better?
- Is it possible to eliminate non-deterministic concurrency control from transaction execution?

# Deterministic Transaction Execution

- H-Store [Kallman et al. '08]
- Designed and optimized for horizontal scalability, multi-core hardware and in-memory databases
- Stored procedure transaction model
- Static partitioning of database
- Assigns a single core to each partition
- Execute transaction serially without concurrency control within each partition

H-Store

# Effect of Increasing Percentage of Multi-Partition Transactions in the Workload

H-Store is sensitive to the percentage of multi-partition transactions in the workload

# Can We Do Better?

Our motivations are

- Efficiently exploits **multi-core and large main-memory systems**
- Provide **serializable** multi-statement transactions for key-value stores
- Scales well under **high-contention** workloads

Desired Properties

- Concurrent execution over shared data
- Not limited to partitionable workloads
- Without any concurrency controls

*Is it possible to have concurrent execution over shared data without having any concurrency controls?*

# Introducing: QueCC

## Queue-Oriented, Control-Free, Concurrency Architecture

*A two parallel & independent phases of priority-driven planning & execution*

**Phase 1:** Deterministic priority-based planning of transaction operations in parallel

- ➡ *Plans take the form of **Prioritized Execution Queues***
- ➡ Execution Queues inherits predetermined priority of its planner
- ➡ Results in a deterministic plan of execution

**Phase 2:** Priority driven execution of plans in parallel

- ➡ Satisfies the **Execution Priority Invariance**

*“For each record (or a queue), operations that belong to higher priority queues (created by a higher priority planner) must always be executed before executing any lower priority operations.”*

# ResilientDB Blockchain Fabric

<https://github.com/resilientdb/>  
<https://resilientdb.com/>

# Evaluation Environment

Hardware	Microsoft Azure instance with 32 core
	CPU: Intel Xeon E5-2698B v3
	<i>32KB L1 data and instruction caches</i>
	<i>256KB L2 cache</i>
	<i>40MB L3 cache</i>
	RAM: 448GB
Workload	YCSB: 1 table, 10 operations, 50% RMW, Zipfian distribution
	TPCC: 9 tables, Payment and NewOrder, 1 Warehouse
Software	Operating System: Ubuntu LTS 16.04.3
	Compiler: GCC with -O3 compiler optimizations

# Effect of Varying Contention

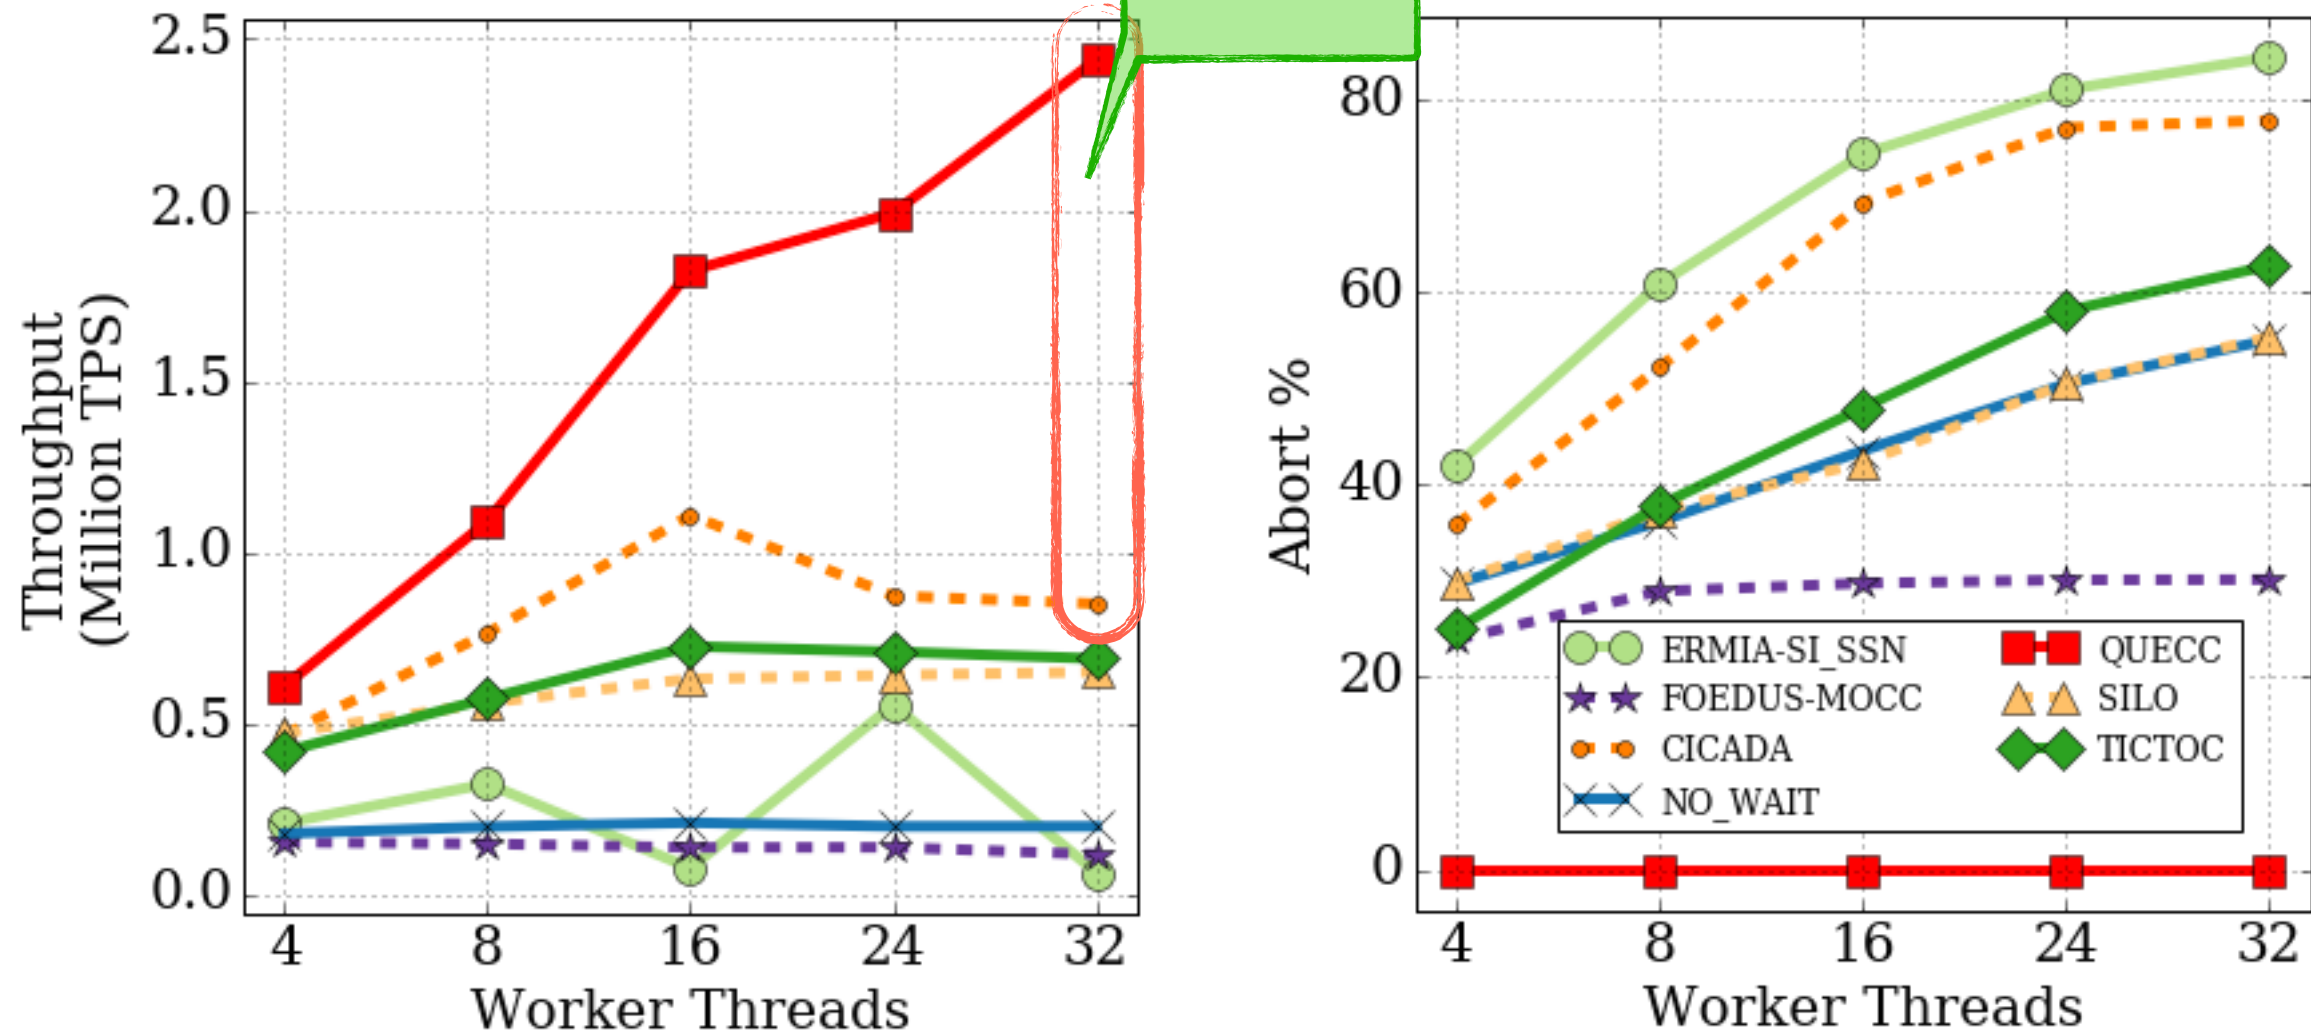

- 5 write and 5 read operation per transaction
- 32 worker threads

Workload contention resiliency  
Cache locality under high-contention

# Effect of Varying Worker Threads

- 5 write and 5 read operation per transaction
- Zipfian theta = 0.99

Avoiding thread coordination & eliminating all execution-induced aborts

# Effect of Increasing Percentage of Multi-Partition Transactions in the Workload

# Effect of Increasing Percentage of Multi-Partition Transactions in the Workload

QueCC is not sensitive to multi-partitioning

# TPC-C Results

**1 Warehouse (highly contended workload)  
50% Payment + 50% NewOrder transaction mix**

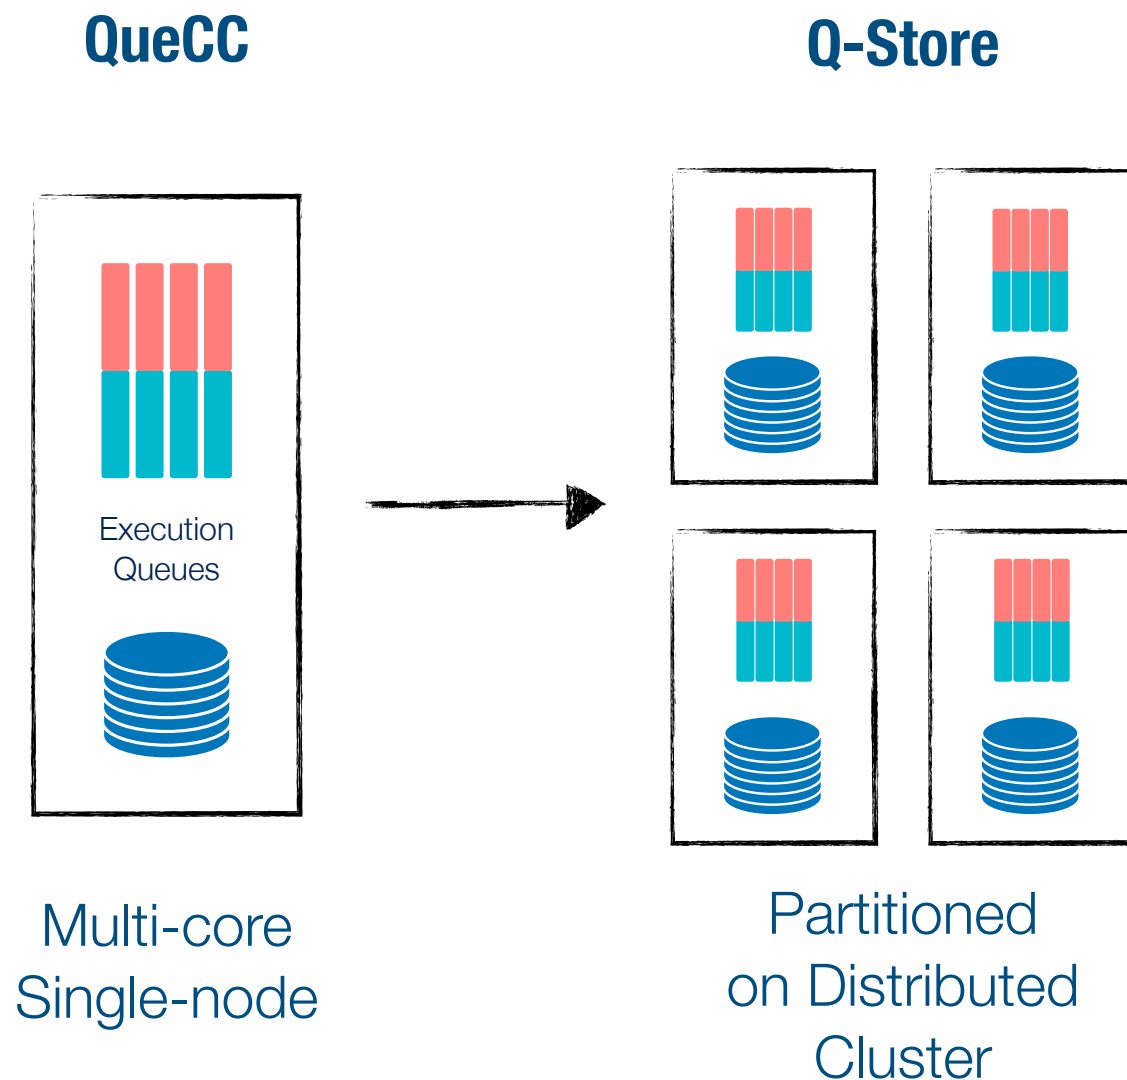

QueCC can achieve up to 3x better performance on high-contention TPC-C workloads

# QueCC Conclusions

- ✓ Efficient, parallel and deterministic in-memory transaction processing
- ✓ Eliminates almost all aborts by resolving transaction conflicts *a priori*
- ✓ Works extremely well under high-contention workloads
