
Building a Payment Splitter iOS Application Based on Blockchain

Yan-Da Chen / Po-Hsuan Chen / Che-Yu Chang
Ling-Yuan Chen / Wei-Ting Ho / Yan-Yu Huang

Outline

- Introduction
- Implementation
 - Frontend Development
 - Backend Development
- Risks and Difficulties
- Future Work
- Demo

Introduction

- Payment splitting applications to keep track of money
- Split Ether
- Cryptocurrency payment splitter application

Introduction

- Payment splitting applications to keep track of money
- Split Ether
- Cryptocurrency payment splitter application

Introduction - Payment Splitter Flow

Create Participants

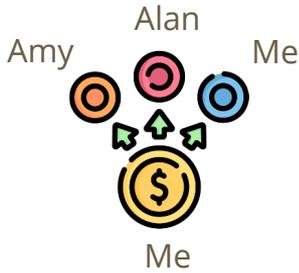

Set Agreement

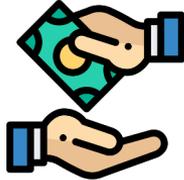

Check Balance

Create Expense

Create Payment

Implementation

Front-end

Swift

Back-end

Implementation - Blockchain

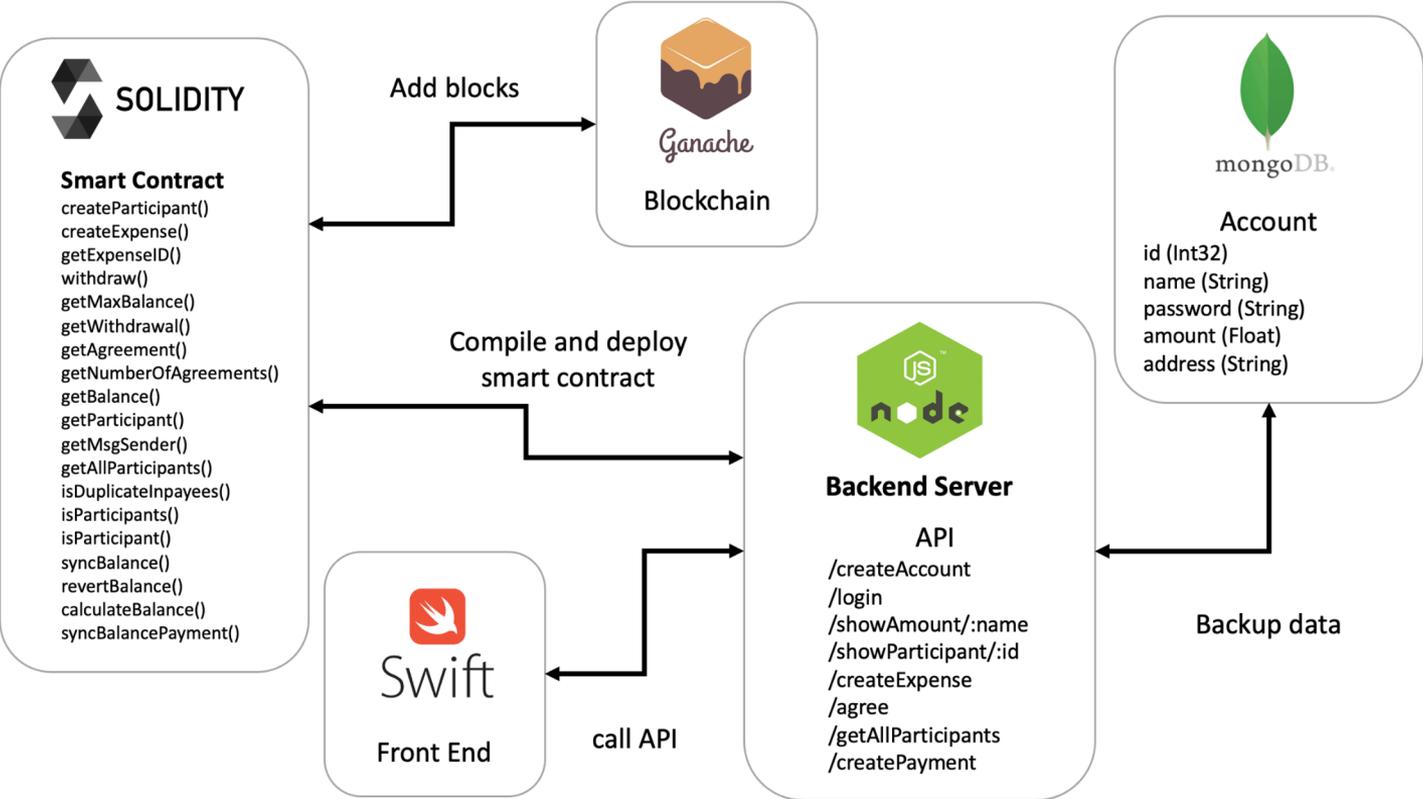

Smart Contract

Development Tool

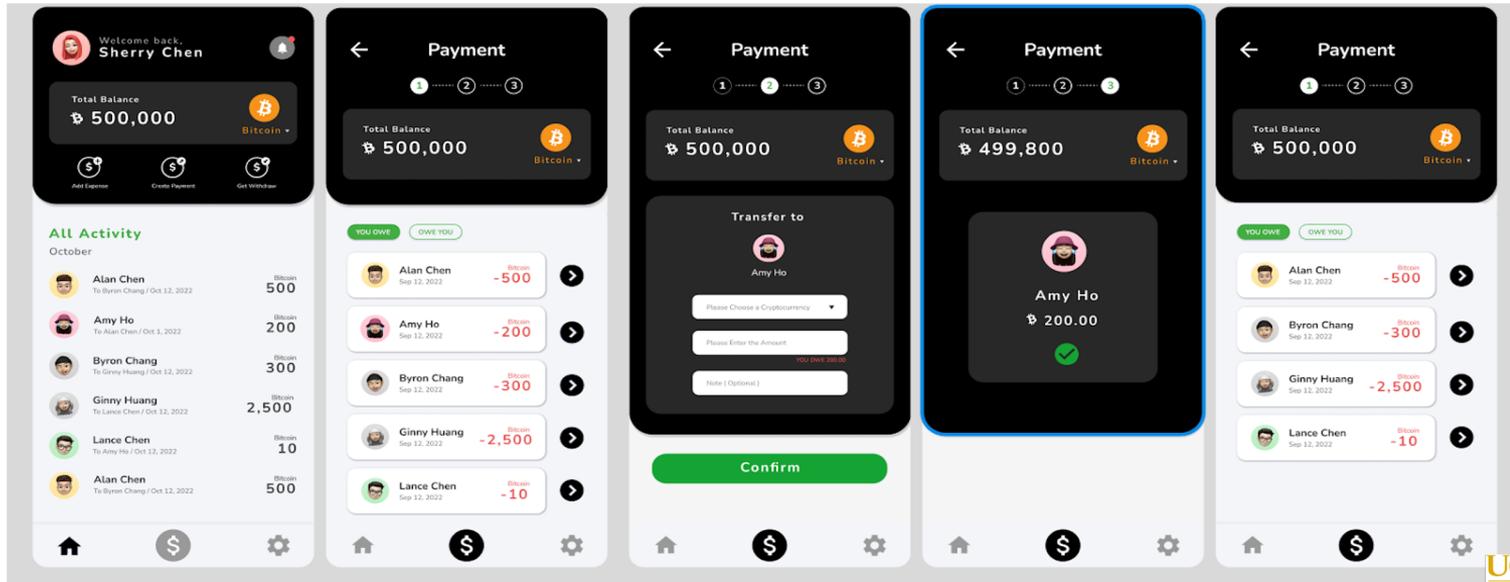

Flowchart

Frontend Development

- Swift UI
 - User interface toolkit
- Swift
 - iOS develop language

Backend Development - API

API	REST Verb	Request Type	Request Structure	Response Structure	Request Description
/createAccount	POST	JSON	<pre>{ "name": "alan", "password": "alan5411" }</pre>	<pre>[{ "info": "Create Account!" }]</pre>	Register a new user and create the password.
/login	POST	JSON	<pre>{ "name": "alan", "password": "alan5411" }</pre>	<pre>{ "info": "Login Successful!" } or { "info": "Wrong Password!" }</pre>	Login a user and get the login status.
/showAmount/:name	GET		/showAccount/alan	<pre>[{ "amount": 99.43462224 }]</pre>	Enter the name to get the amount of that account.

Backend Development - API

<pre>/getAllParticipants</pre>	GET			<pre>{ "info": "check all participants successful", "balanceInfo": [{ "name": "amy", "balance": 17500000000000000 }, { "name": "byron", "balance": -75000000000000000 }, { "name": "sherry", "balance": 12500000000000000 }, { "name": "alan", "balance": -75000000000000000 }, { "name": "ginny", "balance": -15000000000000000 }, {</pre>	Get all participants' names and balance.
--------------------------------	-----	--	--	--	--

Backend Development - API

<code>/showParticipant/:id</code>	GET		<code>/showParticipant/1</code>	<pre>[{ "Name": "alan", "Balance": 0, "Address": "0xE1a62eF686fe820DE76191e88fBa648A37dE696d" }]</pre>	Enter the id to get the name, balance, address from that account.
<code>/createExpense</code>	POST	JSON	<pre>{ "title": "food", "amount": 500000, "date": 2020, "payer": "Amy", "payee": "Sherry" }</pre>	Create an expense, including the title, amount, date, payer and payee.	

Backend Development - API

<code>/createPayment</code>	POST	JSON	<pre>{ "payer": "Amy", "payee": "Sherry", "amount": 500000 }</pre>	<pre>[{ "sources": "200" }]</pre>	Make a payment from one account to another account.
<code>/agree</code>	POST	JSON	<pre>{ "name": "amy", "expenseID": 2 }</pre>	<pre>{ "info": "amy agree expense 2" }</pre>	Set agreement to expense.

Risks and Difficulties

Risks

- **High latency** of blockchain

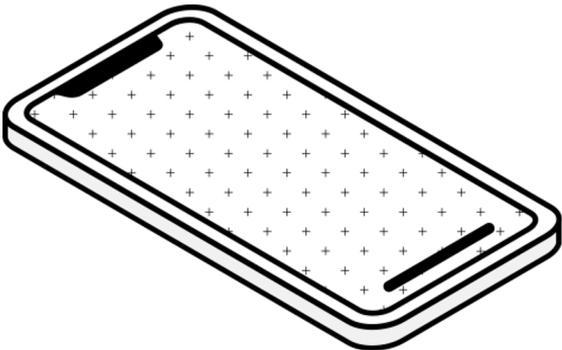

Difficulties

- New development environment
- Integration of backend and smart contract

Future Work

- **Add different splitting actions**
 - split by the **number of shares**
 - split by the **percentage**
 - share by **exact amounts**
- **Combine debts**
 - Ex. A owes B \$10 and B owes C \$10 = A owes C \$10
 - **avoid extra payments**
 - **reduce transaction gas**

Demo

Welcome back,
Sherry Chen

Team Work

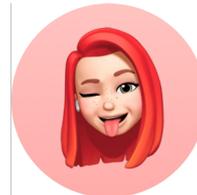

Yan-Yu Huang

- User interface design
- Front end development

Yan-Da Chen

- Smart contract test
- Node.js API test

Po-Hsuan Chen

- Smart contract design
- Node.js API test

Wei-Ting Ho

- Smart contract test
- Node.js API design

Che-Yu Chang

- Front back end integration
- Node.js API design

Ling-Yuan Chen

- Front back end integration
- Smart contract design

Thank You
